What is an MD File?

An **.md** file is a **Markdown file** — a plain text file written using **Markdown syntax**.

- **Markdown** is a **lightweight** markup language used to format **plain text**.
- It uses simple symbols (like **#**, *****, or **-**) to create formatting such as:
 - **Bold text**
 - *Italic text*
 - **# Headings**
 - **- Lists**
- We don't need a **special app** to **write Markdown**
- We can use a **basic text editor** like **VS Code**, **Sublime Text**, or **Notepad++**.

Sample Markdown File

GamutX

Creating MD Files

Step 1: Choose a Text Editor

You can use **any** text editor you're comfortable with. Popular choices include:

VS Code

Sublime Text

Notepad

Step 2: Create a New File

→ **Important:** Make sure to use the **.md** extension

1. Open VS Code

2. **Create New File** → Name it **README.md**

Step 3: Write Markdown Syntax

Here's a starter template:

```
# My Project Title -----> Heading 1

## Introduction -----> Heading 2
Welcome to my project! This document will guide you through the basics.-----> paragraph text

### Features -----> Heading 3
- Easy to use
- Flexible formatting
- Compatible with many platforms ]-----> bullet list

### Installation<----- Heading 3
1. Download the project files.
2. Open the project in your favorite text editor.
3. Start customizing! ]-----> numbered list
```

We've created our first Markdown file!

How to Preview Markdown Files

Preview in VS Code (Local)

Preview on GitHub (Remote)

Preview MD Files

1. Preview in VS Code (local)

1. Open the Preview Pane:

- Press **Ctrl+Shift+V (Cmd+Shift+V on Mac)** or click on the **Preview** button in the top right corner of the editor.

2. Preview on GitHub (Remote)

- GitHub will automatically **render** the Markdown, displaying it as a beautifully formatted document.
- Use this if you're sharing a file or working with others.

[View the File on GitHub](#)

Github Automatically render our file

Markdown Syntax

Here are some of the key features we can use:

Feature	Purpose
• Headings	→ organize and structure your content.
• Bold & Italic	→ text to highlight important points.
• Lists	→ neatly arrange information, including bullet points and numbered steps.
• Links & Images	→ add references or visuals that enhance your document.
• Code Snippets	→ share well-formatted code blocks.
• Code Snippets	→ track tasks and progress.

Headings

Use **#** symbols to **define headings** — just like titles and sections in a document.

Syntax:

level 1 ← **#** Heading 1
level 2 ← **##** Heading 2
level 3 ← **###** Heading 3

Preview

Bold and Italic Text

You can highlight important text using bold or italics.

1. Use **asterisks** ****** → **bold** text
2. or **single** ***** → to make it **italic**

Syntax:

******This text is bold****** → **for bold**
*****This text is italic***** → **for italic**

Preview

Lists

Markdown supports two types of lists:

- Unordered (**bullets**) → use hyphen (-)
- Ordered (**steps**) → use **number** with **dot**

Unordered List Syntax:

```
- Item 1  
- Item 2  
- Item 3
```

Preview

```
• Item 1  
• Item 2  
• Item 3
```

Ordered List Syntax:

```
1. First item  
2. Second item  
3. Third item
```

Preview

```
1. First item  
2. Second item  
3. Third item
```

Links

Add **clickable links** to make your document more complete.

Link Syntax:

```
[OpenAI](https://www.openai.com)
```

Website link

Word to show

Preview

Images

Markdown lets you embed images directly into the doc.

Image Syntax:

Preview

Using Absolute Path

```
project-root/  
├── docs/  
│   └── README.md  
├── assets/  
│   └── images/  
│       ├── preview.png  
│       └── flower.png
```

Image Syntax:

```
![Shot Graph](../assets/images/flower.png)
```

Absolute path

output

Code Blocks

- For **technical** documentation, Markdown makes it easy to include **well-formatted code**.
- Use **triple backticks** (```) for multi-line code blocks.

Syntax:

any programming language

Preview

use triple backtick

```
```python
print("hello world")
```
```

```
console.log('Hello, world!');
```

Checklists

- Checklists are helpful for tracking tasks.
- Use - **[]** for **unchecked items** and - **[x]** for **completed tasks**.

Syntax:

make sure box has space inside

Preview

```
- [ ] Task 1
- [x] Task 2 (completed)
```

checked task

```
README
- [ ] Task 1
- [x] Task 2
```

Syntax:

```
# Headings
## Heading 2
### Heading 3

## Summary

Here's a quick overview of what we just covered:

Feature	Purpose	Markdown Syntax Example
• <b>Heading</b>	→ Organize content	→ <b>## Section Title</b>
• <b>Bold / Italic</b>	→ Highlight text	→ <b>**bold**</b> , <i>*italic*</i>
• <b>Lists</b>	→ Structure info clearly	→ <b>Item, 1. Step</b>
• <b>Links / Images</b>	→ Add references or visuals	→ <b>[Link](URL), ![Alt](image.png)</b>
• <b>Code Blocks</b>	→ Show formatted code	→ <b>```python print("Hi") ```</b>
• <b>Checklists</b>	→ Track tasks	→ <b>[ ] Task, - [x] Done</b>

# Common uses of MD files

## 1. README.md ( Python Project )

- Used in **Python projects, tools, or asset** libraries to:
  - Describe the **purpose of the repository**
  - List **dependencies** or **installation** steps
  - Show **example usage**
  - Provide **contributor** or **license info**

**Location:** Root of a **Git** repository

The screenshot shows a README.md file for a project named "WeatherCLI". The content is as follows:

### WeatherCLI

A simple Python command-line tool to fetch and display current weather conditions for any city using the OpenWeatherMap API.

#### Features

- Search weather by city name
- Displays temperature, humidity, and wind speed
- Supports metric and imperial units

#### Installation

```
git clone https://github.com/yourusername/weathercli.git
cd weathercli
pip install -r requirements.txt
```

#### Usage

```
python weather.py --city "London"
```

Optional flags:

- `--units metric` or `--units imperial`
- `--api-key` to override default key

#### Requirements

- Python 3.7+
- `requests`

#### License

MIT

## 2. GitHub User Profile Management

- Used to customize your **GitHub profile** with a personal intro.
  - Appears on your main GitHub user page
  - **Great** for showcasing projects, background, and links
  - Supports **badges**, **stats**, and **visuals** (renders, reels, etc.)

The screenshot shows a GitHub profile README for user 'barreelroo'. It features a dark theme and includes a personal introduction, a list of affiliations, and a section for GitHub statistics.

barreelroo / README.md

### Hey, I'm Diego Barreiro 🙋

A Computer Science student and software engineer

- 🏢 I'm currently working at [Amazon](#).
- 🏢 I'm one of the founders of [Kodular](#).
- 🧑‍🔬 I'm collaborating with [MIT App Inventor](#).
- 🤝 I volunteer at [Civil Defense](#).

### 3. Project Documentation

- Used as **lightweight** docs for:
  - Tool usage guides (e.g., *"How to use the asset exporter"*)
  - Internal developer notes
  - Version change logs (**CHANGELOG.md**)
  - Pipeline guides (e.g., rig naming, caching steps)

## Asset Exporter Tool – Usage Guide

### Purpose

This tool exports selected assets from Maya to the correct project folder with proper naming and structure.

### How to Use

1. Open Maya and load your scene.
2. Select the asset you want to export.
3. Go to **Custom Shelf > Export Tools > Asset Exporter**
4. In the dialog:
  - Set **Asset Name**
  - Choose **Export Type** (Geo / Rig / Anim)
  - Click **Export**

### Notes

- Assets must be grouped and named correctly (e.g., `char_hero_grp`)
- Output goes to: `assets/exported/[asset_type]/[asset_name].ma`

### Changelog (CHANGES.md)

- `v1.2` – Added auto-grouping and validation checks
- `v1.1` – Export types split by rig/geo
- `v1.0` – Initial release

### Pipeline Standards Reference

- Rig naming: `char_[name]_rig`
- Cache export: run through `CachePrepTool` before exporting

- [Markdown Crash Course – YouTube Video](#)

A **beginner-friendly video** that **explains how Markdown works** with examples, basics, and common formatting rules.

- [Markdown Preview Enhanced – VS Code Extension](#)

A powerful VS Code extension for **viewing Markdown files with live preview, export options (PDF, HTML), dark/light themes, and diagram support.**

- [GitHub Profile Header Generator](#)

A simple online **tool to design and generate profile header images** for your GitHub README. Customize layout, text, and background easily.

# **README.md - for Python Projects**

- What is README.md?
- What Is the Purpose of README.md in a Python Project
- Common Goals a README.md Addresses
- Examples of Open-Source Repositories
- What to Add to a README.md

# What is README.md?

- The **README.md** file is the **front-facing document** of any project.
- When someone **visits** a **Python package** or **GitHub repo**, this is usually the first file they see.
- In a VFX or general Python project, it tells collaborators
  - **what the tool does,**
  - **how to use it, and**
  - **how to get started**
- Always named **README.md**
- Placed in the **root directory** of your project
- **On GITHUB** → This file is automatically shown on the main page of the repo

### Camera Export Tool

A Python utility for exporting Maya cameras to Alembic format, used during layout handoff.

#### Features

- One-click camera export
- Supports multiple camera types
- Exports frame range automatically

#### Installation

1. Copy `camera_export.py` to your Maya scripts folder.
2. Add it to a shelf button or run from the Script Editor.

#### Usage

```
import camera_export
camera_export.export_all()
```

#### Requirements

- Maya 2022+
- PyMel

#### License

# What Is the Purpose of README.md in a Python Project

- In a **Python project or package**, the **README.md** file serves as the **main documentation entry point** — both for users and contributors.

## Purpose

## Explanation

- |                                      |                                                                              |
|--------------------------------------|------------------------------------------------------------------------------|
| • <b>Project Overview</b>            | → Summarizes what the Python package or tool does.                           |
| • <b>Installation Instructions</b>   | → Explains how to install the package (e.g. via pip or from source).         |
| • <b>Usage Examples</b>              | → Shows how to import and use key functions or modules.                      |
| • <b>Package Metadata (via PyPI)</b> | → When publishing to PyPI, README becomes the landing page for the project.  |
| • <b>Contributor Reference</b>       | → Helps developers understand structure, setup, and contribution guidelines. |

# Common Goals a README.md Addresses

A **README.md** file helps ensure your project is **understandable, usable, and maintainable**.

Goal	Description
• <b>Explain the Purpose</b>	→ Describes <b>what the tool or project does</b> and why it exists.
• <b>Support Onboarding</b>	→ Helps <b>teammates</b> or new <b>contributors</b> quickly <b>understand</b> and start using it.
• <b>Clarify Usage</b>	→ Provides <b>clear instructions</b> for both <b>technical and non-technical users</b> .
• <b>Communicate Dependencies</b>	→ Lists <b>what is needed</b> to run the project (e.g., Python version, libraries).
• <b>Act as Lightweight Documentation</b>	→ Serves as a <b>quick reference</b> without needing a full documentation site.

# Examples of Open-Source Repositories

by Pixar

Section	Highlights	Link
• <b>Manim</b>	→ Detailed features, install, usage, contribution guide	→ <a href="#">manim</a>
• <b>OpenTimelineIO</b>	→ Clear usage instructions, plugin info, developer setup	→ <a href="#">OpenTimelineIO</a>
• <b>DearPyGui</b>	→ Visual demos, badges, quick install, screenshots	→ <a href="#">DearPyGui</a>
• <b>Flask</b>	→ Classic README with install, usage, and links to full docs	→ <a href="#">flask</a>
• <b>FastAPI</b>	→ Code samples, badge summary, live demo links	→ <a href="#">fastapi</a>
• <b>Pillow</b>	→ Minimal but practical README with links to docs and tests	→ <a href="#">Pillow</a>
• <b>Black</b>	→ Simple purpose, usage, install, and contribution notes	→ <a href="#">black</a>

## Manim

[README](#)
[MIT license](#)

### Mac OSX

1. Install FFmpeg, LaTeX in terminal using homebrew.
 

```
brew install ffmpeg mactex
```
2. If you are using an ARM-based processor, install Cairo.
 

```
arch -arm64 brew install pkg-config cairo
```
3. Install latest version of manim using these command.
 

```
git clone https://github.com/3b1b/manim.git
cd manim
pip install -e .
manimgl example_scenes.py OpeningManimExample (make sure to add manimgl to path first.)
```

### Anaconda Install

1. Install LaTeX as above.
2. Create a conda environment using `conda create -n manim python=3.8`.
3. Activate the environment using `conda activate manim`.
4. Install manimgl using `pip install -e .`

### Using manim

Try running the following:

```
manimgl example_scenes.py OpeningManimExample
```

This should pop up a window playing a simple scene.

Look through the [example scenes](#) to see examples of the library's syntax, animation types and object types. In the [3b1b/videos](#) repo, you can see all the code for 3blue1brown videos, though code from older videos may not be compatible with the most recent version of manim. The readme of that repo also outlines some details for how to set up a more interactive workflow, as shown in [this manim demo video](#) for example.

## OpenTimelineIO (by Pixar)

[README](#)
[Code of conduct](#)
[Apache-2.0 license](#)

To provide interoperability with other file formats or applications lacking a native integration, the opentimelineio community has built a number of python adapter plugins. This includes Final Cut Pro XML, AAF, CMX 3600 EDL, and more.

**Note:** for releases after v0.16, the [OpenTimelineIO PyPI package](#) will only include the core libraries and file formats. Users that need the full set of adapter plugins should use the [OpenTimelineIO-Plugins PyPI Package](#). Each OpenTimelineIO release will have a matching OpenTimelineIO-Plugins release.

For more information: [#1386](#)

For more information about this, including supported formats, see: <https://opentimelineio.readthedocs.io/en/latest/tutorials/adapters.html>

All adapters except the native `.otio`, `.otioz` and `.otiod` have been relocated to separate repositories under the OpenTimelineIO organization located here: <https://github.com/OpenTimelineIO> The OTIO python bindings also support several other kinds of plugins, for more information see:

- [Media Linkers](#) - Generate media references to local media according to your local conventions.
- [HookScripts](#) - Scripts that can run at various points during OTIO execution (*ie* before the media linker)
- [SchemaDefs](#) - Define OTIO schemas.

### Installing / Quick-Start

The Python-wrapped version of OpenTimelineIO is publicly available [via PyPI](#). You can install OpenTimelineIO via:

```
python -m pip install opentimelineio
```

For detailed installation instructions and notes on how to run the included viewer program, see: <https://opentimelineio.readthedocs.io/en/latest/tutorials/quickstart.html>

### Example Usage

C++:

```
#include <iostream>

#include "opentimelineio/timeline.h"

namespace otio = opentimelineio::OPENTIMELINEIO_VERSION;
```

## DearPyGui

[README](#)
[Code of conduct](#)
[MIT license](#)

A modern, fast and powerful GUI framework for Python

python 3.8 | 3.9 | 3.10 | 3.11 | 3.12 | 3.13
 pypi v2.1.0
 downloads 3M
 License MIT

Embedded Build passing
 Static Analysis passing
 Deployment passing
 docs passing

[Features](#) • [Installation](#) • [How To Use](#) • [Demo](#) • [Resources](#) • [Support](#) • [Tech stack](#) • [Credits](#) • [License](#) • [Gallery](#)

### Features

- Modern look — Complete theme and style control

## Flask

[README](#)
[Code of conduct](#)
[BSD-3-Clause license](#)
[Security](#)

### Flask

Flask is a lightweight [WSGI](#) web application framework. It is designed to make getting started quick and easy, with the ability to scale up to complex applications. It began as a simple wrapper around [Werkzeug](#) and [Jinja](#), and has become one of the most popular Python web application frameworks.

Flask offers suggestions, but doesn't enforce any dependencies or project layout. It is up to the developer to choose the tools and libraries they want to use. There are many extensions provided by the community that make adding new functionality easy.

### A Simple Example

```
save this as app.py
from flask import Flask

app = Flask(__name__)

@app.route("/")
def hello():
 return "Hello, World!"

$ flask run
* Running on http://127.0.0.1:5000/ (Press CTRL+C to quit)
```

### Donate

The Pallets organization develops and supports Flask and the libraries it uses. In order to grow the community of contributors and users, and allow the maintainers to devote more time to the projects, [please donate today](#).

### Contributing

See our [detailed contributing documentation](#) for many ways to contribute, including reporting issues, requesting features, asking or answering questions, and making PRs.

## FastAPI

[README](#) [MIT license](#) [Security](#)

### Typer, the FastAPI of CLIs

## Typer

If you are building a CLI app to be used in the terminal instead of a web API, check out [Typer](#).

Typer is FastAPI's little sibling. And it's intended to be the **FastAPI of CLIs**.  

### Requirements

FastAPI stands on the shoulders of giants:

- [Starlette](#) for the web parts.
- [Pydantic](#) for the data parts.

### Installation

Create and activate a [virtual environment](#) and then install FastAPI:

```
$ pip install "fastapi[standard]"
```

--> 100%

Note: Make sure you put "fastapi[standard]" in quotes to ensure it works in all terminals.

### Example

#### Create it

Create a file `main.py` with:

```
from typing import Union

from fastapi import FastAPI

app = FastAPI()
```

## Pillow

### Pillow

#### Python Imaging Library (Fork)

Pillow is the friendly PIL fork by [Jeffrey A. Clark and contributors](#). PIL is the Python Imaging Library by Fredrik Lundh and contributors. As of 2019, Pillow development is [supported by Tidelift](#).

[README](#) [License](#) [Security](#)

tests	<a href="#">Test Docker</a> <a href="#">passing</a> <a href="#">Wheels</a> <a href="#">failing</a> <a href="#">codecov</a> <a href="#">90%</a> <a href="#">oss-fuzz</a> <a href="#">fuzzing</a>
package	<a href="#">DOI</a> <a href="#">10.5281/zenodo.15781505</a> <a href="#">lib</a> <a href="#">pypi</a> <a href="#">v11.3.0</a> <a href="#">downloads</a> <a href="#">14.7M/month</a> <a href="#">opensaf best practices</a> <a href="#">passing</a>

### Overview

The Python Imaging Library adds image processing capabilities to your Python interpreter.

This library provides extensive file format support, an efficient internal representation, and fairly powerful image processing capabilities.

The core image library is designed for fast access to data stored in a few basic pixel formats. It should provide a solid foundation for a general image processing tool.

### Report a vulnerability

To report a security vulnerability, please follow the procedure described in the [Tidelift security policy](#).

# Black

[README](#) [Code of conduct](#) [MIT license](#) [Security](#)

The following notable open-source projects trust *Black* with enforcing a consistent code style: pytest, tox, Pyramid, Django, Django Channels, Hypothesis, attrs, SQLAlchemy, Poetry, PyPA applications (Warehouse, Bandersnatch, Pipenv, virtualenv), pandas, Pillow, Twisted, LocalStack, every Datadog Agent Integration, Home Assistant, Zulip, Kedro, OpenOA, FLORIS, ORBIT, WOMBAT, and many more.

The following organizations use *Black*: Dropbox, KeepTruckin, Lyft, Mozilla, Quora, Duolingo, QuantumBlack, Tesla, Archer Aviation.

Are we missing anyone? Let us know.

## Testimonials

Mike Bayer, [author of SQLAlchemy](#) :

I can't think of any single tool in my entire programming career that has given me a bigger productivity increase by its introduction. I can now do refactorings in about 1% of the keystrokes that it would have taken me previously when we had no way for code to format itself.

Dusty Phillips, [writer](#):

*Black* is opinionated so you don't have to be.

Hynek Schlawack, [creator of attrs](#) , core developer of Twisted and CPython:

An auto-formatter that doesn't suck is all I want for Xmas!

Carl Meyer, [Django](#) core developer:

At least the name is good.

Kenneth Reitz, creator of [requests](#) and [pipenv](#) :

This vastly improves the formatting of our code. Thanks a ton!

## Show your style

Use the badge in your project's README.md:

```
[![Code style: black](https://img.shields.io/badge/code%20style-black-000000.svg)](https://github.com/p
```

# What to Add to a README.md

Section	Description	Required?
• Project Title	→ Name of the <b>tool, script, or application</b> .	→ Yes
• Description	→ A short summary of <b>what the project does and why it exists</b> .	→ Yes
• Features	→ Bullet list of <b>key functions or benefits</b> .	→ Optional
• Installation	→ <b>Steps to install</b> or set up the project	→ Yes
• Usage	→ <b>How to run or use</b> the tool, with examples or <b>screenshots</b>	→ Yes
• Requirements	→ Python version and <b>external libraries or software dependencies</b> .	→ Yes
• Folder Structure	→ <b>Visual layout of project</b> files for navigation and clarity.	→ <i>Optional</i>
• License	→ Defines <b>how the code can be used, shared, or modified</b> <i>(MIT, Apache, internal, etc.)</i> .	→ Yes

Section	Description	Required?
• Contributors	→ Names of <b>authors</b> , <b>maintainers</b> , or <b>collaborators</b> .	→ <i>Optional</i>
• Contact / Support	→ Info on <b>how users can get help or report issues</b> .	→ <i>Optional</i>
• Changelog	→ <b>Summary of changes</b> per version or milestone.	→ <i>Optional</i>
• Screenshots / Visuals	→ <b>Images</b> or <b>GIFs</b> showing the <b>tool/UI/output</b> .	→ <i>Optional</i>
• Roadmap	→ List of upcoming features or <b>future improvements</b> .	→ <i>Optional</i>
• Badges	→ GitHub <b>badges</b> showing <b>version</b> , <b>license</b> , <b>test status</b> , etc.	→ <i>Optional</i>

## 1- Project Title

Name of the **tool**, **script**, or **application**.

```
AssetPublisher
```

## 2- Description

A short summary of what the **project** does and **why** it exists.

```
AssetPublisher is a Python-based tool designed for VFX pipelines to help artists and TDs publish assets (models, rigs, animations) into the studio's shared environment. It handles versioning, file validation, and automatic structure creation.
```

## 3- Features

Bullet list of **key functions** or **benefits**.

```
✨ Features
```

- Auto-versioning of published files
- Ensures naming convention compliance
- Generates metadata for pipeline tracking
- Supports Maya, Houdini, and Nuke outputs
- Logs every publish action for auditing

## 4 - Requirements

Python version and **external libraries** or **software dependencies**.

- Python 3.8+
- Maya 2022+
- PySide2
- requests, pyyaml

## 5- Installation

Steps to install or set up the project

```
🚀 Installation
1. Clone the repository:
```bash
git clone https://github.com/yourstudio/AssetPublisher.git
cd AssetPublisher
```

2. Install the required dependencies:
```bash
pip install -r requirements.txt
```

3. Add the path to your pipeline environment:
```bash
export PYTHONPATH=$PYTHONPATH:/path/to/AssetPublisher
```
```

## 6- Usage

How to run or use the **tool**, with examples or **screenshots**

```
✨ Usage
Run from the terminal or shelf button inside Maya:
```bash
python asset_publisher.py --asset "hero_rig" --type rig --user "alex"
```

Or from Python directly:
```python
from asset_publisher import publish

publish(asset_name="hero_rig", asset_type="rig", user="alex")
```

Optional Flags
* `--dry-run` : Test publish without writing files
* `--note "Fixing eye blink bug"` : Add a change note
```

## 7- Folder Structure

Visual layout of **project** files for navigation

```
...
AssetPublisher/

### AssetPublisher

python 3.8+ license repo not found build repo or workflow not found

AssetPublisher is a Python-based tool designed for VFX pipelines to help artists and TDs publish assets (models, rigs, animations) into the studio's shared environment.

It handles versioning, file validation, and automatic structure creation.

#### ✦ Features

- Auto-versioning of published files
- Ensures naming convention compliance
- Generates metadata for pipeline tracking
- Supports Maya, Houdini, and Nuke outputs
- Logs every publish action for auditing

#### 🚀 Installation

1. Clone the repository:

```
git clone https://github.com/yourstudio/AssetPublisher.git
cd AssetPublisher
```

2. Install the required dependencies:

```
pip install -r requirements.txt
```

3. Add the path to your pipeline environment:

```
export PYTHONPATH=$PYTHONPATH:/path/to/AssetPublisher
```

#### ✦ Usage

# **GitHub User Profile MD files**

- What Are User Profile MD Files?
- Example GitHub Profile Repositories
- How to Create a GitHub Profile README
- Why Create a Profile MD File?
- Edit User Profile MD File
- Tools for Creating User Profile README.md Files

# What Are User Profile MD Files?

A **User Profile MD file** is a special **README.md** written in Markdown format and displayed **on your GitHub profile page**.

- It acts like a **personal bio** or **portfolio**
- Shows your skills, projects, and contact info
- It's visible at the top of your [GitHub profile](#)

## Preview

The preview shows a GitHub profile page for 'barreeiroo / README.md'. The header features the name 'Hey, I'm Diego Barreiro' with a hand icon. Below it is the title 'A Computer Science student and software engineer'. The main content is a bulleted list of achievements and contact information, each preceded by a small icon. At the bottom, there is a section titled 'Diego Barreiro Perez's GitHub Stats' which includes a table of statistics and a circular progress indicator showing a 'B+' grade. To the right of the stats table are three large numbers: '2,750' for Total Contributions, '1' for Current Streak, and '15' for Longest Streak. Social media icons for LinkedIn, Instagram, Facebook, and Twitter are at the very bottom.

| Diego Barreiro Perez's GitHub Stats |     |

M0nica / README.md

Hi, I'm Monica 🍌 📖

**MONICA POWELL**

software engineer, content creator & community organizer

I'm a software engineer who is passionate about making contributing to open-source more approachable, creating technology to elevate people, and building community. Some technologies I enjoy working with include ReactJS, Jamstack (JavaScript, APIs + Markup) and GraphQL. In 2020, I was selected to be an inaugural [GitHub Star](#) 🌟 based on my involvement in the tech community. My interest in the React ecosystem led me to launch [React Robins](#), a community for women and non-binary ReactJS developers.

# How to Create a GitHub Profile README

## Create a New Repository

- Login to Your Profile
- Create New Repo
- In the Repository name field,
  - Type your **GitHub username exactly same**

The screenshot shows the GitHub 'Create a new repository' page. The page title is 'Create a new repository' with a link to 'Try the new experience'. Below the title, it says 'A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository](#).' A note states 'Required fields are marked with an asterisk (\*)'.

The 'Repository template' section has a dropdown menu set to 'No template'.

The 'Owner' and 'Repository name' fields are both set to 'RajB4'. A red dashed arrow points from the 'Repository name' field to a red box containing the text 'Write your GitHub username'.

A blue box contains the text: 'RajB4/RajB4 is a special repository that you can use to add a README to your GitHub profile. Make sure it's public and initialize it with a README to get started.'

The 'Description (optional)' field is empty.

The 'Visibility' section has two options: 'Public' (selected) and 'Private'. A purple dashed arrow points from the 'Public' option to a purple box containing the text 'Make Repo Public'.

The 'Initialize this repository with' section has a checkbox 'Add a README file' which is checked. A green dashed arrow points from this checkbox to a green box containing the text 'Make sure it checked'.

The 'Add .gitignore' section has a dropdown menu set to 'None'.

The 'Choose a license' section has a dropdown menu set to 'None'.

A note at the bottom says 'This will set P as the default branch. Change the default name in your settings.'

A green button at the bottom right is labeled 'Create repository'. An orange dashed arrow points from this button to an orange box containing the text 'Click to Create Repo'.

## Edit Your README.md File

- This file will now act as your GitHub profile.
- You can edit it directly on GitHub or locally in a code editor like VS Code.

The screenshot shows the GitHub web interface for editing a README.md file. At the top, a green banner states: "RajB4/RajB4 is a special repository: its README.md will appear on your profile!". Below this, the breadcrumb "RajB4 / README.md" is shown, followed by "in main". On the right, there are buttons for "Cancel changes" and "Commit changes...". A purple dashed arrow points from the "Commit changes..." button to a purple box labeled "Commit Changes ones Done".

Below the breadcrumb, there are tabs for "Edit" and "Preview". A green dashed arrow points from the "Preview" tab to a green box labeled "to see live changes".

The main content area displays the README content:

- Hi there, I'm Raj!** (with a clapping hands emoji)
- A designer, editor, and AI artist merging creativity with code.
- About Me** (with a person emoji):
  - I'm a Graphic Designer passionate about visuals and storytelling.
  - A Video Editor who loves crafting emotion through frames and sound.
  - An AI Artist pushing boundaries with generative visuals and creative tools.
  - Currently working as an AI Research Major focused on ComfyUI, building experimental workflows and visual pipelines.
- Project Highlights** (with a rocket emoji):
  - Adhairya – Short Film**
  - Role: Editor • 2D Animator • Sound Designer • Composer
    - Designed and animated 2D sequences
    - Engineered and mixed custom sound design
    - Composited visuals and finalized the film's post-production

An orange bracket on the right side of the content area points to an orange box labeled "Add Your Info like:", which contains a list of items:

- Profile Info
- Tech Stack
- Projects
- GitHub Stats
- Currently Learning
- Achievements
- Contact

## View Your GitHub Profile

- Visit your GitHub Dashboard
- You'll now see the contents of your README.md displayed at the top of your profile

The screenshot shows a GitHub profile for Raj Basera (RajB4). The profile includes a profile picture, name, username, and bio. The README.md content is displayed below the profile information. Annotations with arrows point to specific sections of the README.md, explaining their purpose:

- Short intro – who you are and what you do:** Points to the "Hi there, I'm Raj!" section, which includes a greeting and a brief bio: "A designer, editor, and AI artist merging creativity with code."
- summary of your background and current work:** Points to the "About Me" section, which lists key skills and current work: "I'm a Graphic Designer passionate about visuals and storytelling," "A Video Editor who loves crafting emotion through frames and sound," "An AI Artist pushing boundaries with generative visuals and creative tools," and "Currently working as an AI Research Major focused on ComfyUI, building experimental workflows and visual pipelines."
- what you worked on and your role:** Points to the "Project Highlights" section, which lists projects and roles: "Adhairya – Short Film" (Role: Editor • 2D Animator • Sound Designer • Composer) and "Designed and animated 2D sequences," "Engineered and mixed custom sound design," and "Composited visuals and finalized the film's post-production."
- Tools and software you know – grouped by type:** Points to the "Tech & Software Knowledge" section, which lists various tools and software used, grouped by type: Design & Editing (Photoshop, Illustrator, InDesign, Premiere Pro, After Effects), Video Editing (Avid Media Composer), Sound Design (Adobe Audition), AI Workflows (ComfyUI, Stable Diffusion, Runway ML), and Other Tools (Blender, Figma, DaVinci Resolve).
- Helps recruiters or collaborators reach you easily:** Points to the "Connect With Me" section, which lists links to the user's portfolio (rajbasera.com) and LinkedIn profile (linkedin.com/in/rajbasera).

# Why Create a Profile MD File?

Here are the main reasons:

**Showcase your skills** and tools you work with

**Highlight key projects** (links, short descriptions)

Help others **understand your role in a team or community**

Create a **standardized** way to **document who you are**

**Make a good first impression** for recruiters or collaborators

GamutX

# Create User Profile MD File

## Objective

- Create and publish a personal **GitHub** profile **README** using a starter template.

## Instructions:

- You'll get a starter **README.md** template — open it in any code editor.
- Fill in your name, a short intro, and a few tools you use.
- Create a new repo named **exactly like your GitHub username**.
- Replace the default README with your edited version.
- Commit and push the changes — or just edit directly on GitHub.
- Open your profile page — your custom README should show up at the top.

# Edit User Profile MD File

## Option 1: Edit Directly from Your GitHub Profile Page

- Go to your GitHub profile <https://github.com/yourusername>
- Scroll down to the profile **README** section
- Click the **pencil icon** in the **top-right** of the section
- The **markdown editor** will open in your **browser**

click to edit MD file

## Edit window shown

## Option 2: Edit Through the Repository View

- Click the “**Repositories**” tab
- Look for the repository that matches your **username** exactly
  - Example: If your **username** is **Prahlad-Nasane**, the repo will be named **Prahlad-Nasane**

Click on this username-named repository

## Open & Edit the README.md

- **Locate** and click on the file named **README.m**
- The file will open in **preview mode**
- In the **top-right corner** of the file view, click the **pencil icon**
- This opens the file in **GitHub's markdown editor**

click the pencil icon to edit

## Make Changes in the Markdown Editor

In this editor, you can:

- Add or edit text (e.g., update your **bio** or **description**)
- Insert links (e.g., to **LinkedIn** or **portfolio**)
- Change formatting using basic **HTML** or **Markdown**
- Add **badges**, **images**, or **section headers**

Can See Live Preview

Commit new changes

Add new Content or  
Modify old content

# Tools for Creating User Profile README.md Files

- You don't need to write your **GitHub profile** from scratch
- there are tools that help you **design, preview, and generate** professional-looking profile **README.md** files

## 1. [ProfileMe.dev](https://ProfileMe.dev)

A beginner-friendly site with **form-based inputs**.

- Fill out your name, **skills, projects, and social links**
- It generates the **Markdown** code for you instantly
- You can copy and paste it into your **README.md** file

Good for **first-time users** who want a simple starting point

## 2. GitHub Profile README Generator (GPRM)

A polished tool with more **customization options**

- Offers predefined sections like: “About Me,” “**Tech Stack**,” “**GitHub Stats**,” “**Connect With Me**”
- Allows you to preview your profile before exporting the **code**
- Great for **developers** who want some visual flair

Helpful for building a clean, professional layout

The screenshot shows the GitHub Profile README Generator (GPRM) web application. At the top, it says "m4G" and "GitHub Profile README Generator". Below this, there are two buttons: "Star this repo 23161" and "Fork on GitHub 7814". The main form is divided into several sections:

- Title**: A text input field with the placeholder "Hi 🙋, I'm" and a label "name".
- Subtitle**: A text input field with the placeholder "A passionate frontend developer from India".
- Work**: A section with multiple rows for work experience. Each row has a label (e.g., "I'm currently working on", "I'm looking to collaborate on", "I'm looking for help with", "I'm currently learning", "Ask me about", "How to reach me", "All of my projects are available at") and a text input field for the project name and link.

The form is designed to be clean and professional, with a focus on providing a structured layout for a GitHub profile README.

### 3. Readme.so

A **flexible** drag-and-drop **editor**

- Choose from **ready-made sections** (e.g., “**Installation**,” “**Contributing**,” “**FAQ**”)
- Rearrange and **edit live** with preview
- Designed for all types of **README files**, not just **profiles**

Useful if you're building README files for other projects too

## How These Tools Help

### Benefit

- **No need to memorize syntax**
- **Faster setup**
- **Visual layout**
- **Easy to update**

### Why It Matters

- They handle the Markdown formatting for you
  - You get a working profile file in minutes
  - You can preview before copying into GitHub
  - You can go back and generate updated versions
- 

# **Markdown in VFX Workflows**

- Why Markdown is Important in VFX

# Why Markdown Is Important in VFX

- In the VFX industry, we work with complex pipelines, cross-disciplinary **teams**, and **time-sensitive deliveries**.
- **Markdown** helps make that documentation **fast**, **consistent**, and **accessible**.

## 1. Documenting Tools/Workflows/Steps

Use Markdown for:

- **Asset** creation instructions
- **Animation**-to-**comp** handoffs
- Render and export **flows**

## Folder Strcure

```
Project_Root/
├── sequences/
│ ├── SEQ010/
│ │ ├── shot_015/
│ │ │ ├── anim/
│ │ │ │ ├── shot_015_anim_v004.ma
│ │ │ │ └── exports/
│ │ │ ├── alembic/
│ │ │ └── shot_015_char_main_v001.abc
├── tools/
│ └── sg_submit_export.py
└── README.md
```

## README.md

### Alembic Export Workflow

#### Overview

This document outlines the steps required to export animated geometry from Maya to Alembic (.abc) format. This ensures consistency across departments Rendering.

This workflow applies to layout and animation files that need to be passed downstream in the pipeline.

#### Prerequisites

- Maya 2022+ with studio pipeline tools installed
- Asset naming conventions followed  
(Refer to [Asset Naming Guidelines](#))
- Shotgun Toolkit integration enabled

#### Step-by-Step Instructions

##### 1. Open the Approved Animation File

Open the latest animation scene from the shot directory:

```
/projects/PROJECT_NAME/sequences/SEQ010/shot_015/anim/shot_015_anim_v004.ma
```

##### 2. Prepare the Geometry

- Select all geometry to be exported
- Confirm asset names follow naming standards:
  - Characters: `char_main_geo`
  - Props: `prop_*`

##### 3. Bake Animation

## 2. Works with Version Control (Git)

Markdown is **Git-friendly**, just like your **scripts** and **config files**. This means:

- You can track changes over time
- You can see **who edited** what, and when
- You can roll back mistakes

### 3. Team Collaboration

Teams can:

- Suggest edits
- Leave comments on documentation
- Merge changes through pull requests

#### Example:

Your team maintains a shared pipeline **wiki** on **GitHub**.

**Devs** edit the same Markdown file to update tool usage instructions.

## 4. Documenting Scripts and Tools

Have a **custom tool**? A Python script? A submission wrapper?

Use **Markdown** to quickly describe:

- *What it does*
- *How to run it*
- *Inputs/outputs*

# **Why Markdown File are Important**

- Limitation with MS Word or Google Docs?
- Normal Markdown Files vs. README.md
- Why Use Both README.md & Other Markdown Files?
- Why Use Markdown?
- Common Use-Cases Where Markdown Is Used

# Limitation with MS Word or Google Docs?

## What Word and Google Docs Are Good At:

- Rich formatting (**fonts, tables, colors**)
- Designed for polished reports and presentations
- Great for printed documents

when it comes to technical teams, scripting, or pipeline tools — **especially in VFX — they fall short in key areas.**

## Limitations of Word/Docs

- **Not version-controlled** → hard to track changes
- **Formatting isn't portable** → breaks in scripts or tools
- **Poor Git integration** → hard to use in repos
- **Not diff-friendly** → can't review changes line-by-line
- **Heavy and centralized** → locked files and sync delays

## Word/Google Docs vs Markdown

### Feature

### Word/Google Docs

### Markdown (.md)

- **Works in version control**
- **Lightweight**
- **Formatting**
- **code and scripts**

→ Difficult to track changes cleanly

→ No, often slower

→ Limited outside Microsoft/Google tools

→ No

→ Easy — Git shows line-by-line diffs

→ Yes, very fast

→ Easily converted to HTML, PDF, etc.

→ Yes — supports code blocks

# Normal Markdown Files vs. README.md

- Markdown files (.md) are commonly used for project documentation,
- but **not all** Markdown files serve the same purpose.
- One special case is the **README.md**.

Let's understand the difference between:

Normal Markdown files

VS

A README.md file

## Normal Markdown Files

- These are **general-purpose documentation files** that support your project.

### Purpose-Specific

Each file usually focuses on one topic:

- **guide.md** →
  - Explains how to use a feature
- **changelog.md** →
  - Lists version history
- **meeting-notes.md** →
  - Logs internal discussions

### Flexible Placement

- You can place it anywhere
  - Inside **/docs**
  - In a **/notes** folder
- Or even beside the script

### Not Automatically Displayed on Git Platforms

- On **GitHub** or **GitLab**, these files won't be shown by default.
- Users have to **navigate into folders** to view them.

## README.md

*Primary documentation file, always shown first when someone visits your repository.*

```
my-vfx-tool/
├── src/
│ └── tool.py
├── docs/
│ └── guide.md
├── assets/
│ └── demo-scene.mb
└── README.md
```

- **Main entry point** for project documentation
- **Always displayed by default** on GitHub/GitLab
- Gives an **immediate overview** of the **project**
- **Should include:**
  - Project title and description
  - Installation steps
  - Usage instructions
  - Tool requirements
  - License and contributor info
- **A clear and well-written README** helps user
  - **understand, use, & contribute to project**

# Why Use Both README.md & Other Markdown Files?

Using both gives you a clean, organized way to document your project.

## 1. README.md

- Gives a **quick overview** of the project
- Shown by default on **GitHub/GitLab**
- Covers basics: what it is, how to use it, how to contribute

## 2. Other Markdown Files

- Used for **detailed documentation**
- **Examples:**
  - **guide.md** → step-by-step usage
  - **changelog.md** → version history
  - **troubleshooting.md** → common issues

## Why It Matters

- Keeps your **README** focused
- Helps users **find** info **faster**
- Scales well as your **project** grows

## Folder Example:

```
project/
├── README.md
├── docs/
│ ├── guide.md
│ └── changelog.md
```

it should always be on root

We can kept this in subfolders

- Use README.md for **first impressions**, and other .md files for the **details**.

## Quick Comparison Table

| Feature                    | Normal Markdown Files          | README.md                              |
|----------------------------|--------------------------------|----------------------------------------|
| • <b>File Name</b>         | → Flexible (guide.md, etc.)    | → Fixed (README.md)                    |
| • <b>Purpose</b>           | → Specific documentation tasks | → Main project overview                |
| • <b>Display on GitHub</b> | → Not shown by default         | → Shown automatically on repo homepage |
| • <b>Location</b>          | → Anywhere in the project      | → Typically in the root folder         |
| • <b>Importance</b>        | → Secondary or supporting info | → First impression, essential context  |

# Why Use Markdown?

Here's why Markdown is so handy, especially in **technical** and **collaborative environments**:

- **Easy to Learn**

- You don't need to **memorize** a lot. The **formatting** is **simple** — you'll get used to it quickly.

- **Plain Text Format**

- **Markdown files** are just plain **.txt** files with some formatting symbols.
- No need for heavy apps like Word.

- **Works Everywhere**

- Because it's plain text, it works on:
  - Windows
  - Mac
  - Linux
  - Even inside terminals and code editors

- **Version Control Friendly**

- If you're using Git (which is common in **VFX** and **dev teams**), Markdown files show clear changes.
- That's not easy with **Word docs**.

- **Flexible for Many Uses**

- You can use Markdown for:
  - Notes and checklists
  - Project documentation (like **README.md**)
  - Wikis or internal guides
  - Blogs or reports

- **Easy to Convert**

- You can turn Markdown into:
    - HTML (for **websites**)
    - PDF (for sharing)
    - Slides and more
    - Tools like **MkDocs** or **Pandoc** handle this.
- 

# Common Use-Cases Where Markdown Is Used

Let's look at **specific areas** where you'll commonly find **.md files** in the real world:

1. Repository Information
2. Project Documentation
3. GitHub User Profiles
4. Wikis
5. Software/Tool Documentation
6. Open Source Repositories
7. Academic Papers and Research Reports

## 1. Repository Information

These examples show how Markdown is used in **repositories** to describe the **project** and **its purpose**.

- [Hello-World by octocat](#)
  - A very simple example of a **README.md file**. It's great for beginners.
- [Linux Kernel by torvalds](#)
  - A practical example from a massive **open-source project**. The documentation is **simple** and **functional**.
- [TensorFlow by tensorflow](#)
  - This shows how professional projects use Markdown for detailed documentation.

## 2. Project Information

Here are some examples of Markdown files used in specific projects to explain how they work.

- [ebook2audiobook by DrewThomasson](#)
  - A small project with a clear **README.md**.
- [Django by django](#)
  - A detailed and polished example from a widely-used framework.

### 3. GitHub User Profiles

Markdown is also used for **GitHub profiles** to give a **quick introduction**. Here are some examples:

#### [sraka](#)

- A simple profile with basic information.

#### [vinta](#)

- Another minimalistic example that's neat and professional.

#### [abhisheknaidu](#)

- A creative profile with a bit of flair.

#### [m0nica](#)

- A well-structured profile showcasing professional achievements.

#### [eddiejaoude](#)

- Focused on community and contributions.

#### [sanjay-kv](#)

- A clean and straightforward profile example.

## 4. Wikis

Markdown is used in **wikis** for **organizing detailed information** about **projects**. Here are some examples:

### [Awesome Python by vinta](#)

- A collection of Python resources organized using Markdown.

### [VS Code Wiki by Microsoft](#)

- A detailed wiki for the VS Code project.

### [Awesome OSS by sereneblue](#)

- Another curated list using Markdown.

### [Awesome Projects by toweave](#)

- Shows how Markdown can structure large lists.

## 5. Documentation for Projects, Tools, and Software

Markdown is a key tool for **project documentation**. These examples show how to write it **effectively**:

- [Awesome Readme by matiassingers](#)
  - A collection of excellent **README.md** files.
- [Vue.js Documentation](#)
  - Clear and professional documentation for the **Vue.js framework**.
- [Node.js Documentation](#)
  - Another good example of project documentation.
- [MkDocs Documentation](#)
  - Markdown is used to generate professional docs here.

## 6. Official Open Source Software Repositories

Large **open-source** projects also rely heavily on **Markdown** for their **documentation**. Here are some examples:

- [VS Code by Microsoft](#)
  - Shows how Markdown is used for community-driven projects.
- [Eclipse Theia](#)
  - A good example of organized contributions and documentation.
- [Vim](#)
  - A classic project using Markdown.

## 7. Academic Papers and Reports

Markdown is also used in **academic** and **research-related projects**. Here are some examples:

- [ERC-Academic-Profiles by drdav](#)
  - Shows how Markdown can be used for sharing academic content.
- [Papers We Love](#)
  - A collection of papers organized using Markdown.

## Create a Simple Markdown File

### Instructions:

- Create a file named **about\_me.md**.
- Add a title with your name using a Level 1 heading (#).
- Write a short introduction paragraph about yourself.
- Create a list of three hobbies or interests you have.

## Create a Checklist

### Instructions:

- Create a file named **task\_list.md**.
- Add a title using a Level 2 heading (##).
- Write a checklist of five tasks you want to complete today.
- Mark one task as completed and leave the others unchecked.

## Write a README File for a Project

### Instructions:

- Create a file named **README.md**.
- Add a title for your project using a Level 1 heading.
- Write a short introduction explaining what the project does.
- Include a numbered list of steps for installation.
- Add a license section at the end with a placeholder for the license type.

## Document Your Favorite Tools

### Instructions:

- Create a file named **tools.md**.
- Add a title using a Level 1 heading (#).
- Create a table with three columns: **Tool Name**, **Purpose**, and **Platform**.
- List at least three tools, their purposes, and supported platforms in the table.

## Add Formatting to a Document

### Instructions:

- Create a file named **formatted\_text.md**.
- Add a title using a Level 2 heading (##).
- Write three sentences:
  - Make one **bold**.
  - Make another italic.
  - Use both bold and italic formatting for the last sentence.

# Thank You
