

Shot Folder Auto-Creator

Objective: Build a simple command-line tool (using only `sys.argv`) that automatically creates a standard folder structure for a new VFX shot.

In every VFX studio, when a new shot is added to a show, artists need a clean folder structure to start work. Normally a pipeline tool creates this structure automatically instead of someone doing it manually.

You will build a mini version of that tool.

✅ What Your Script Should Do

Your script must be named:

`shotsetup.py`

It must be executed like this:

```
python shotsetup.py <shot_name> <root_path>
```

Example:

```
python shotsetup.py SH020 D:\Projects\Seq01
```

This should create:

```
D:\Projects\Seq01\SH020\  
    plate\  
    comp\  
    cache\  
    render\  
    scripts\  

```

📁 Required Subfolders To Create

Inside every shot folder, create exactly these subfolders:

```
plate  
comp  
cache  
render  
scripts
```
